reading frame (ORF)15 of the RPGR gene. The method is useful for detecting a certain disease state e.g., X-linked retinitis pigmentosa (XLRP). The kit is useful for detecting and measuring disease causing mutations in biological fluids and tissues and for localising mutation in tissues. The mutant RPGR gene is useful in gene therapy techniques and for screening agents capable of affecting the expression of the sequences and/or the biological activity of mutant RPGR. They are preferably useful for identifying agonists and antagonists of RPGR. The mutant RPGR gene is also useful in identification of potential pharmaceutical targets in high throughput screening assays and forensic analysis. The present sequence is the imperfect direct repeat of human RPGR exon ORFIS repetitive DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligonucleotides AAQ44802-Q44809 were used in the characterisation of a sequence element found 1.6kb upstream of the cellular c-myc gene. The PUR element (see AAQ44801) is located in a region of DNA bending activity which is a structural feature often associated with origins of DNA replication. The PUR protein AAR50310 binds to the PUR element. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                  Cloning and expression of PUR protein, involved in regulation of DNA replication - also oligo:nucleotide(s) and antibodies for use in the treatment of proliferative diseases, e.g. cancer.

PUR elements are purine-rich 24 nucleotide DNA sequences which occur at cuelaryotic origins of replication and 5' flanking regions of some cellular oncogenes. The PUR procesi (ARR50310) was originally identified as a 27kD HeLa cell nuclear factor that bound in a sequence-specific manner to a major site of DNA bending located 1.6kb upstream of the transcription start site of the human c-myc gene; the site recognised by PUR procein had the sequence AAQ44801. This is the nucleotide sequence of the PUR element used in the method of the invention, involving the use of the PUR protein and its fragments, which inhibit PUR protein binding to PUR element or other proteins. Inhibitors of PUR activity may be useful for treating viral infections and hyperproliferative diseases such as cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the nucleotide sequence of an oligonucleotide used in the method of the invention, involving the use of the PUR protein and its fragments, which inhibit PUR protein binding to PUR element or other proteins inhibitors of PUR activity may be useful for treating viral infections

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The probes AAT99270-T99277 were used to screen for positive clones containing a 467 bp Sau3AI fragment of the human c-myc upstream region cloned into pUC19. Isolated sequences were then used as probes to screen an expression library for sequences encoding the PUR protein. The PUR sequence can be used to identify chemical or biological compounds that bind to PUR or binding fragments of PUR. Inhibitors of PUR activity may be used to treat hyperproliferative diseases such as cancer

The present invention describes a monoclonal antibody that specifically binds to an epitope of the PUR protein. Antibodies that bind to the PUR protein and neutralise PUR activity may be used to treat hyperproliferative diseases such as cancer. PUR antibodies may be used diagnostically to detect aberrant expression of the PUR protein and/or mutations in the PUR persent esquence represents an oligonucleotide used in the identification and characterisation of the PUR protein and its sequence element PUR repeat, in an example from the
Oligonucleotide MR0700 used in PUR identification/characterisation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a monoclonal antibody that specifically binds to an epitope of the PUR protein. Antibodies that bind to the PUR protein and neutralise PUR activity may be used to treat hyperproliferative diseases such as cancer. FUR antibodies may be used diagnostically to detect aberrant expression of the PUR protein and/or mutations in the PUR gene. The present sequence represents an oligonucleotide used in the identification and characterisation of the PUR protein and its sequence element PUR repeat, in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The Hew Invention relates to detecting open chromatin in genomic DNA by determining the hybridization of acapture probe to a treated sample amplification products and the untreated sample amplification products and the untreated sample amplification products.

CC Specifically, the method comprises preparing a chromatin sample with an open chromatin DNA cleaving agent or produce the chromatin sample with an open chromatin DNA cleaving agent to produce fragments performing a first amplification reaction using the fragments as a substrate, to produce treated-sample amplification products; concerning a second amplification reaction using the fragments as a substrate, to produce treated-sample amplification products and the chromatin DNA cleaving agent, to produce untreated-sample amplification products and the chromatin DNA cleaving agent, to produce untreated-sample amplification products with a capture probe; and cerraming the hybridization of the capture probe; and determining the hybridization of the capture probe to the products ample amplification products with a capture probe to the capture amplification products seem the presence of open chromatin in the genomic DNA. Also given treated-sample amplification products as compared to the hybridization of the capture probe to the untreated-sample amplification products as compared to the hybridization of the capture probe to the untreated sample amplification products as compared to the hybridization of the capture probe to the untreated sample amplification products as compared to the hybridization of creatment in genomic DNA. The methods and chromatin state profiling array, for detecting the presence of open chromatin in genomic DNA, used in chromatin state profiling array, for detecting the response of cells and patients to candidate or reatment and evaluating the response of cells and patients to confidence or primer for one-sided PCR amplification of PNAse I treatment and evaluating profiling array.

Creatment and evaluating the response of DNAse I treatmen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       genomic DNA by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

This invention describes a novel composition comprising an enzyme which contains a heterologous functional domain that provides altered tunctionality in a nucleic acid cleavage assay. The enzyme comprises a 5, conclease, preferably a thermostable 5, nuclease, or a polymerase which is altered in sequence related to a naturally occurring sequence of a copymerase such that it exhibits reduced DNA synthetic activity from that comprises to fit he naturally occurring polymerase. Preferably the polymerase is a thermostable polymerase from a Thermus species such as T. aquaticus, T. Clarvage assay and an animo acid sequence that provides an improved substrate binding activity in the nucleic acid cleavage assay and an amino acid sequence that provides improved cleavage assay and an amino acid sequence that provides inproved cleavage assay and an amino acid sequence that provides inproved cleavage assay and an amino acid sequence that provides inproved cleavage assay and an amino acid sequence that provides inproved cleavage assay and an amino acid sequence that provides inproved cleavage structure comprises a RNA target nucleic acid (a cytochrome cleavage structure comprises a RNA target nucleic acid (a cytochrome comprises an non-target cleavage of the invasive cleavage structure comprises of fluorescence energy transfer or by detecting radioctivity luminescence, which is then detected by captering radioctivity luminescence, which is then detected by comprising and octivity the nucleic acid (a cell lysate) comprising substrate concleavage product. The enzyme is employed for detecting target DNAs and cleavage product. The enzyme is employed for detecting target DNAs and concleavage product. The enzyme is employed for detecting target DNAs and mutant alleles of genes including genes from humans, other animal or plants that are or may be associated with for cheavage product in a parameter and mutant alleles of genes including genes and the parameter and the parameter and mutant alleles of genes including genes and concerne
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  disease or other conditions. In addition, the enzymes may be useful for detecting and identifying strains of microorganisms including bacteria, fungi, protozoa, ciliates and viruses, preferably detecting and identifying viruses having RNA genomes, such as hepatitis C and human
                                                                                                                                                                                                                                                                                                                                                                                     Composition comprising enzyme which comprises heterologous functional domain that provides altered functionality in nucleic acid cleavage assay, useful for cleaving nucleic acid, and detecting presence of RNA
                                                                                                                                                                                                                                V, Ma W;

This invention describes a novel composition comprising an enzyme which contains a heterologous functional domain that provides altered to contains a heterologous functional domain that provides altered to contains a heterologous functional domain that provides altered to a nuclease, preferably a thermostable 5' nuclease, or a polymerase which is altered in sequence related to a naturally occurring sequence of a polymerase such that it exhibits reduced DNA synthetic activity from that of thermostable polymerase from a Thermus species such as T. aquaticus, T. flavus, T. thermophilus, T. filiformus or T. scotoductus. The enzyme comprises a hereologous functional domain, an amino acid sequence that provides an improved substrate binding activity in the nucleic acid cleavage assay and an amino acid sequence that provides improved cleavage seasy and an amino acid sequence that provides improved cleavage structure comprises a RNA target nucleic acid (a cytochrome P550, or cytokine RNA). Cleavage of the invasive cleavage structure comprises a non-target cleavage product, which is then detected by detecting radioactivity luminescence, phosphorescence, fluorescence of polarisation or charge. The enzyme is useful for cleaving a uncleic acid to the enzyme which produces at least one detectable nucleic acid to the enzyme which produces at least one detectable cleavage product. The enzyme is employed for detecting target DNAs and RNAs comprising wild-type and mutant alleles of genes including genes from humans, other animal or plants that are or may be associated with disease or other conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition comprising enzyme which comprises heterologous functional domain that provides altered functionality in nucleic acid cleavage assay, useful for cleaving nucleic acid, and detecting presence of RNA

This invention describes a novel composition comprising an enzyme which contains a heterologous functional domain that provides altered according a heterologous functional domain that provides altered contains a heterologous functional domain that provides altered in sequence related to anaturally occurring sequence of a altered in sequence related to anaturally occurring sequence of a copymerase such that it exhibits reduced DNA synthetic activity from that of the maturally occurring polymerase. Preferably the polymerase is a comprises a heterologous functional domain, an amino acid sequence that or thermostable polymerase from a Thermus species such as T. aquaticus, T. flilformus or T. soctoductus. The enzyme comprises a heterologous functional domain, an amino acid sequence that provides an improved substrate binding activity in the nucleic acid cleavage sasay and an amino acid sequence that provides improved cleavage structure comprises a RNA target nucleic acid (a cytochrome packer) or cytokine RNA). Cleavage function cleavage structure comprises a RNA target nucleic acid (a cytochrome packer) or cytokine RNA). Cleavage product, which is then detected by detecting radioactivity luminescence, phosphorescence, fluorescence comprising and nucleic acid to the enzyme which produces at least one detectable cleavage product. The enzyme is useful for cleavage DNAs comprising wild-type and mutant alleles of genes including genes from humans, other animal or plants that are or may be associated with disease or other conditions. In addition, the enzyme such animal or plants that are or may be associated with indust, protozoa, ciliates and viruses, preferably detecting and human clear animal or plants when a perzyme is neighborescence in an implication or described and viruses, preferably detecting and human clear animal or plants when an enzyme is neighborescence and viruses, preferably detecting and human clear animal or plants has been any be allocating and industrible and viruses, preferably preferably provided an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Composition comprising enzyme which comprises heterologous functional domain that provides altered functionality in nucleic acid cleavage assay, useful for cleaving nucleic acid, and detecting presence of RNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel composition comprising an enzyme which contains a heterologous functional domain that provides altered functionality in a nucleic acid cleavage assay. The enzyme comprises a 5' nuclease, preferably a thermostable 5' nuclease, or a polymerase which is altered in sequence related to a naturally occurring sequence of a polymerase such that it exhibits reduced DNA synthetic activity from that of the naturally occurring polymerase. Preferably the polymerase is a thermostable polymerase from a Thermus species such as T. aquaticus, T. flavus, T. thermophilus, T. fillformus or T. scotoductus. The enzyme comprises a heterologous functional domain, an amino acid sequence that provides an improved substrate binding activity in the nucleic acid cleavage assay and an amino acid sequence that provides improved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    background specificity in the nucleic acid cleavage assay. The invasive cleavage structure comprises a RNA target nucleic acid (a cytochrome P450, or cytokine RNA). Cleavage of the invasive cleavage structure generates an non-target cleavage product, which is then detected by detecting fluorescence, mass or fluorescence energy transfer or by detecting radioactivity luminescence, phosphorescence, fluorescence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hall JG;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates used as antiviral agents and synthons.
for cleaving a nucleic acid
             which involves exposing a sample (a cell lysate) comprising substrate nucleic acid to the enzyme which produces at least one detectable cleavage product. The enzyme is employed for detecting target DNAs and RNAs comprising wild-type and mutant alleles of genes including genes from humans, other animal or plants that are or may be associated with disease or other conditions. In addition, the enzymes may be useful for detecting and identifying strains of microorganisms including bacteria, fungl, protozoa, ciliates and viruses, preferably detecting and identifying viruses having RNA genomes, such as hepatitis C and human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method has been developed for the identification of a nucleic acid

comprises: (a) introducing into the system a random library of nucleic acid catalyste (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalysic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of a least part of the SBDs in such systems. Nucleic acid molecules with endomuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid motecules with are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid motecules with a socites and infection. They may also be used to detect genetic distance ascites and infection. They may also be used to detect genetic drift and muttancions in diseased cells and to determine c-raf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of such they appered to the subscience of sugar/phosphate modifications increases stability against nuclease and activity. AAV90922 to AAV93877 repersent NACs that can be used in the method, specifically for modulating the expression of a Raf gene

Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin. Mcswiggen J; Zwick M, Pavco P, WPI; 2000-647423/62. Blatt L,

Claim 32; Page 80; 164pp; English.

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATI Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and interferon alpha

Baldwin, C., Hopkinson, I. and Ahmad, N. Nina.

Primers and methods for detecting mutations in the procollagen II

gene (COL2A1) that indicate a genetic predisposition for a

COL2A1-associated disease

Patent: US 5948611-A 99 07-SEP-1999;

(Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pyTT3 vector. Library went through one round of normalization. Tissue samples provided by Dr. Brian Dieckgraefe (Washington University, dieck@im.wustl.edu); colonic mucosa represents a range of disease involvement from moderate to severe Crohn's disease; samples include both perforating (fistulas) and non-perforating samples. Library constructed by Bento Soares and M. Fatima Bonaldo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1. .28

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           COMMENT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                               (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pwb42 (gql #732114|gpl AF125072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xil0-Gold (Stratagene) cells and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pwalp42 (gil #732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                         Rm. 308, Biomedical Polymers Research Bldg., 20 S. 2030 E., SLC, UT 84112, USA

/clone_lib="Moouse 10kb plasmid UUGCIM library"
/clone_lib="Woouse 10kb plasmid UUGCIM library"
/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was bydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerses and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose get a 9.5 to
10.5 kb range using preparative agarose get of plasmid All the vector was ligated
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XIIO-Gold (Stratagene) cells
and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Unpublished (2000)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ORIGIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AR129072.1), a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll X110-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Dunn, D., Aoyagi, A., Barber, M., Beacorn, T., Duval, B., Hamil, C., Islam, H., Longacre, S., Mahmoud, M., Meenen, E., Pedersen, T., Reilly, M., Rose, M., Rose, R., Stokes, R., Tingey, A., von Niederhausern, A. and Wright, D., Weiss, R., Mouse whole genome scaffolding with paired end reads from 10kb plasmid inserts

Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonicleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AF129072.1) a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adappored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

Sequence tag generated by 5' RACE of total RNA from gene trap ES
cell line. ES cell lines harboring insertion mutation of target
gene are available upon request from TIGEM. Annotation information
available from TIGEM
Class: Gene Trap.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /clone="SALK 079650.53.10.x"

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli Xili0-Gold (Stratagene) cells and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMAD42 (gil 4732114|gb|AR12972.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xilio-Gold (Stratagene) cells and selected for ampicillin resistance."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                       23237482

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
